

TELEMEDICINE & RURAL AMERICA

In the United States,
around 60 million people
live in rural communities.

Patients in rural communities
may face obstacles to care,
such as:

lack of
providers and
specialists

limited public
transportation

far distances
to care and
emergency
services

additional social
and economic
barriers

Telemedicine can help patients
overcome these challenges, but

1 in 4 rural Americans
lack a broadband internet
connection at home.

**Improving access
to broadband
and telemedicine**
can bridge disparities for
rural patients.
